Sprint 2 AI-Log

Improve README.md

Purpose of AI Use: To improve the README.md setup instructions so that new users can easily clone and run the CareerConnect project.

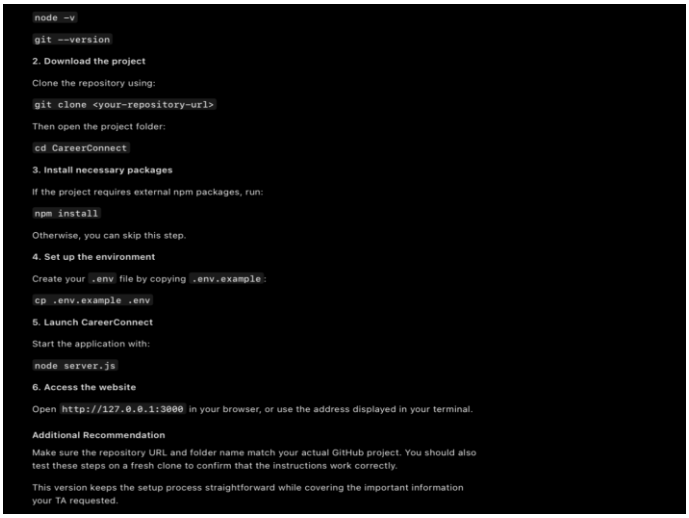

Prompt: My TA mentioned that our CareerConnect README.md setup instructions were incomplete. Help me add clear step-by-step instructions for cloning the GitHub repository, installing npm dependencies if needed, and running the project locally. Keep the instructions simple and easy to follow.

AI Suggested Content: The AI suggested adding steps for installing Node.js and Git, cloning the repository, configuring the environment, installing dependencies if needed, and starting the server.

Validation: Reviewed the suggested instructions against the project's existing README.md and setup requirements.

Decision: Modified before use.

Reflection: The AI helped me make the setup instructions clearer and easier for someone using our project for the first time.

Sprint 2 Planning

Purpose of AI Use: To help create the Sprint 2 Planning document for CareerConnect using the same format as Sprint 1.

Prompt: Help me create Sprint 2 Planning using our Sprint 1 document, GitHub issues, project board, and team responsibilities. Include the sprint goal, backlog, priorities, risks, effort estimation, team capacity, and work-plan table. Keep it simple and similar to Sprint 1.

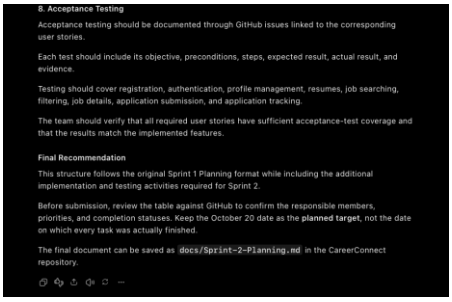

AI Suggested Content: The AI suggested organizing the planning into the required sections and creating a table showing tasks, assigned members, priorities, target completion dates, and statuses.

Validation: Reviewed the suggested planning against our Sprint 1 document, GitHub tasks, and assignment requirements.

Decision: Modified before use.

Reflection: The AI helped me organize our Sprint 2 Planning clearly and make sure the required information was included.

AT-8.1: Create Jobs Page

Purpose of AI Use: To help prepare for the acceptance test based on the Sprint 2 guidelines.

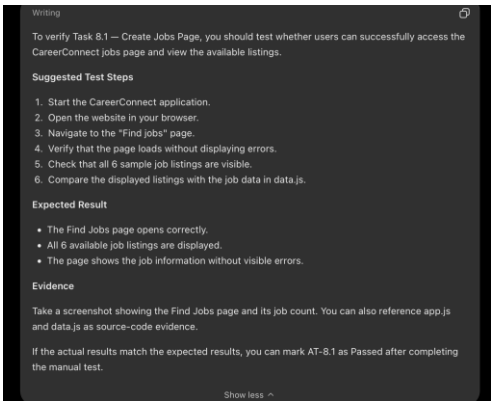

Prompt: By reviewing the Sprint 2 slides and project guidelines I provided, help me create an acceptance test for Task 8.1 — Create Jobs Page. Explain what I should test and what evidence I need for GitHub.

AI Suggested Content: The AI suggested verifying that the Find Jobs page opens correctly, displays all 6 jobs, and loads without errors.

Validation: I tested the website, confirmed that all 6 jobs appeared, and took screenshots.

Decision: Modified before use.

Reflection: The AI helped me understand the testing requirements and organize my GitHub acceptance test.

AT-8.3: Display Job List

Purpose of AI Use: To help prepare the job list acceptance test based on the Sprint 2 guidelines.

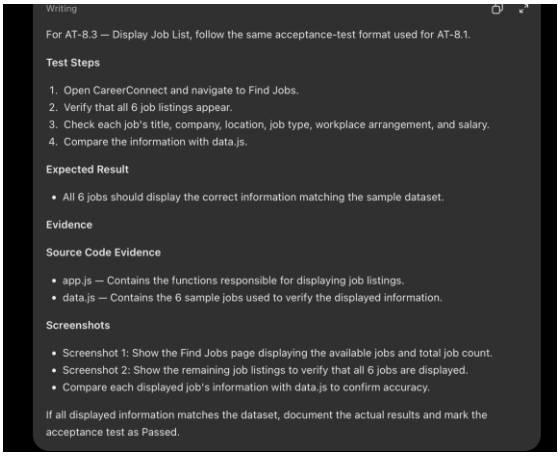

Prompt: By reviewing the Sprint 2 slides and guidelines I provided, help me create AT-8.3 — Display Job List using the same formatting as AT-8.1. Make sure to include detailed testing steps and evidence, including screenshots and source code references.

AI Suggested Content: The AI suggested verifying that all 6 jobs display the correct title, company, location, job type, workplace arrangement, and salary. It also recommended comparing the displayed information with data.js and providing screenshots and code references as evidence.

Validation: I checked all 6 job listings against data.js and confirmed that the information matched.

Decision: Modified before use.

Reflection: The AI helped me structure the acceptance test consistently and understand what evidence was needed to demonstrate that the job listings displayed correctly.

AT-9.1: Add Search

Purpose of AI Use: To help prepare the search bar acceptance test based on the Sprint 2 requirements.

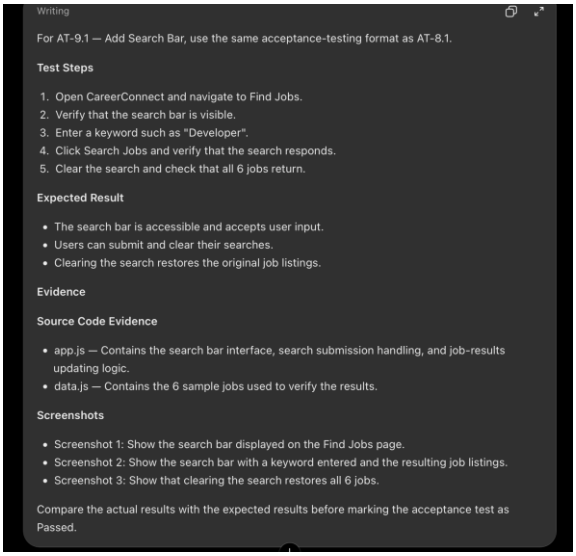

Prompt: By reviewing the Sprint 2 slides and guidelines I provided, help me create AT-9.1 — Add Search Bar using the same formatting as AT-8.1. Include the testing steps, expected results, and detailed evidence with screenshots and source code references.

AI Suggested Content: The AI suggested verifying that the search bar is visible, accepts keywords, allows users to submit searches, and can be cleared. It also recommended checking that the original 6 jobs return after clearing the search.

Validation: I tested the search bar, entered keywords, and verified that clearing the search restored all 6 jobs.

Decision: Modified before use.

Reflection: The AI helped me organize the acceptance test and identify what needed to be checked to confirm that the search bar worked correctly.

AT-9.2: Implement Search Functionality

Purpose of AI Use: To help prepare the acceptance test for the job search functionality based on the Sprint 2 guidelines.

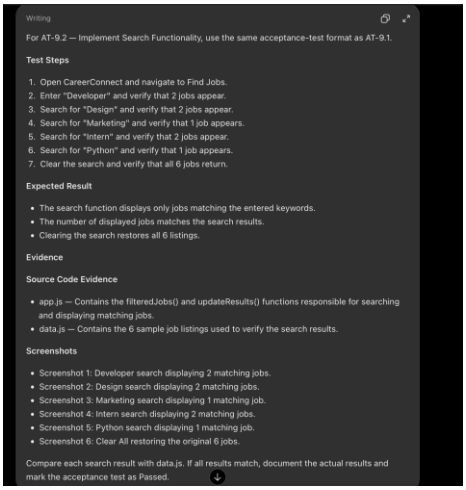

Prompt: By reviewing the Sprint 2 slides and guidelines I provided, help me create AT-9.2 — Implement Search Functionality using the same formatting as AT-9.1. Include detailed testing steps, expected results, and evidence with screenshots and source code references.

AI Suggested Content: The AI suggested testing different keywords such as Developer, Design, Marketing, Intern, and Python. It recommended verifying that only matching jobs appear and comparing the results with the sample data in data.js.

Validation: I tested all five keywords and confirmed that the search results matched the available job data.

Decision: Modified before use.

Reflection: The AI helped me identify useful search scenarios and document the test results clearly.

AT-10.1: Add Filter Options

Purpose of AI Use: To prepare an acceptance test for the job-filtering options based on the Sprint 2 guidelines.

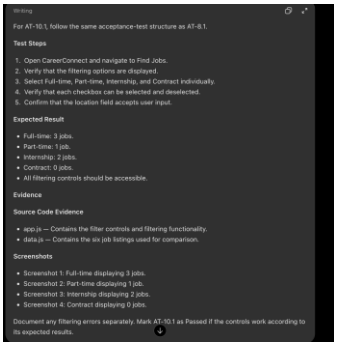

Prompt: By reviewing the Sprint 2 slides and guidelines I provided, help me create AT-10.1 — Add Filter Options using the same format as AT-8.1. Include clear testing steps, expected results, and detailed evidence with screenshots and source code references.

AI Suggested Content: The AI recommended verifying that all job-type filters are visible and selectable, checking the location input field, and confirming the expected results for Full-time, Part-time, Internship, and Contract.

Validation: I tested all four job-type filters and confirmed the expected results. I also verified that the location field accepted input and documented an accent-related issue separately.

Decision: Used as suggested.

Reflection: The AI helped me organize the testing process and verify the filter controls using consistent acceptance-testing criteria.

AT-10.2: Create Filter Function

Purpose of AI Use: To test the job-filtering functionality, investigate an identified bug, and verify the correction.

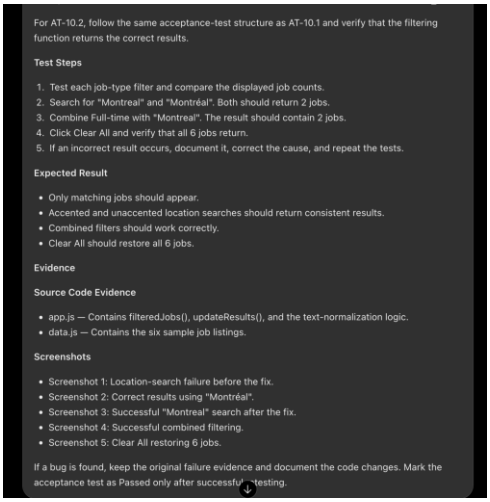

Prompt: Using the Sprint 2 guidelines and the same acceptance-test format as AT-10.1, help me prepare AT-10.2 — Create Filter Function. Include testing for job types, locations, combined filters, and clearing filters. Also explain how to document and retest any bugs found.

AI Suggested Content: The AI recommended checking the expected job counts, combining location and job-type filters, and verifying that clearing filters restores all six jobs. It also suggested using text normalization to correct the accent-related location-search issue and repeating the tests after the fix.

Validation: I tested the filters, identified the Montreal accent bug, updated app.js, and completed regression testing. All tested scenarios passed after the correction.

Decision: Used as suggested.

Reflection: The AI helped me identify the cause of the bug, understand the solution, and verify that the filtering functionality worked correctly after the fix.

For AT-10.2, follow the same acceptance-test structure as AT-10.1 and verify that the filtering function returns the correct results.

Test Steps

1. Test each job-type filter and compare the displayed job counts.
2. Search for "Montreal" and "Montréal". Both should return 2 jobs.
3. Combine Full-time with "Montreal". The result should contain 2 jobs.
4. Click Clear All and verify that all 6 jobs return.
5. If an incorrect result occurs, document it, correct the cause, and repeat the tests.

Expected Result

- Only matching jobs should appear.
- Accented and unaccented location searches should return consistent results.
- Combined filters should work correctly.
- Clear All should restore all 6 jobs.

Evidence

Source Code Evidence

- app.js — Contains filteredJobs(), updateResults(), and the text-normalization logic.
- data.js — Contains the six sample job listings.

Screenshots

- Screenshot 1: Location-search failure before the fix.
- Screenshot 2: Correct results using "Montréal".
- Screenshot 3: Successful "Montreal" search after the fix.
- Screenshot 4: Successful combined filtering.
- Screenshot 5: Clear All restoring 6 jobs.

If a bug is found, keep the original failure evidence and document the code changes. Mark the acceptance test as Passed only after successful testing.

AT-11.1: Open Job Details

Purpose of AI Use: To help prepare the acceptance test for opening job details based on the Sprint 2 guidelines.

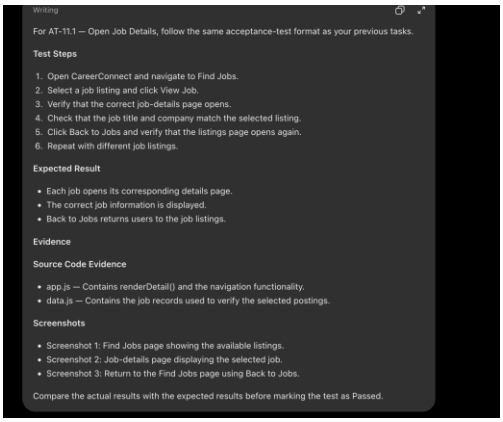

Prompt: By reviewing the Sprint 2 slides and guidelines I provided, help me create AT-11.1 — Open Job Details using the same formatting as my previous acceptance tests. Include testing steps, expected results, and detailed evidence with screenshots and source code references.

AI Suggested Content: The AI recommended verifying that clicking a job listing opens the correct job-details page and that the Back to Jobs button returns users to the listings.

Validation: I manually opened job-details pages and tested the navigation back to the job listings.

Decision: Referred to as an example.

Reflection: The AI helped me understand how to structure the navigation test and identify the evidence needed for my GitHub issue.

AT-11.2: Display Job Information

Purpose of AI Use: To help prepare an acceptance test verifying that job-details pages display complete and accurate information.

Prompt: Based on the Sprint 2 guidelines, help me create AT-11.2 — Display Job Information using the same formatting as AT-11.1. Include the information that should be verified, clear testing steps, and detailed evidence with screenshots and source code references.

AI Suggested Content: The AI suggested checking the job title, company, location, salary, description, responsibilities, and requirements. It also recommended comparing the displayed information against data.js.

Validation: I reviewed the job-details pages and compared the displayed information with the six job records in data.js.

Decision: Referred to as an example.

Reflection: The AI helped me identify which job details needed verification and how to document the results consistently.

Continuous Integration (CI)

Purpose of AI Use: To create a complete CI workflow following the Sprint 2 guidelines.

Prompt: By reviewing the Sprint 2 guidelines and CareerConnect project files I provided, create a complete GitHub Actions CI workflow. It should verify the Node.js version, check dependencies, validate the SQLite database, run JavaScript syntax checks and automated

tests, and display information about who pushed the changes. Please provide the complete YAML code without modifying the application files.

AI Suggested Content: The AI provided a complete main.yml workflow using Node.js 24. It included dependency verification, SQLite database integrity checks, JavaScript syntax validation, automated tests, and information about the user, branch, commit, and changed files.

Validation: I implemented the suggested CI code in GitHub Actions and verified that all workflow steps passed successfully.

Decision: Used as suggested.

Reflection: The AI helped me create a CI workflow that met the project requirements and automatically verified the application whenever changes were pushed.
