AI Use Log - Sam

User Stories: CareerConnect Base Template

Purpose of AI Use: To help create the initial structure and base template for the CareerConnect website while following the project requirements, starting from the given 15 user stories.

Chat Link or Prompt/Response: Use the project PDF in the folder on this machine as the main source for all instructions. Build a base template website for the CareerConnect job search platform. This must only be a starting idea using these given 15 user stories as a vague idea. The website must include both frontend functionality using only HTML, CSS and JavaScript. Keep the structure clean, organized and realistic for a SOEN 341 undergraduate project. The interface should look professional and well designed without being overly advanced or too basic. Use clear file organization, sensible naming and code that a student could realistically write, explain and maintain. Avoid unnecessary complexity or generic generated content.

AI Suggested Content: The AI provided an initial website structure and code for the CareerConnect platform based on the project requirements

Validation: Compared the suggestions against project requirements and reviewed them during the team meeting.

Decision: Modified before use.

Reflection: The AI helped create a starting point for the website, but the code still needed to be reviewed and adjusted to fit our project and the level of the course.

Responsible Person: Sam Taheri

User Stories 1 and 2 Tasks: Registration Backend Setup

Purpose of AI Use: To help build and test the registration and login backend.

Chat Link or Prompt/Response: Create a simple backend for registration without a database. Keep accounts in memory. Connect the registration and login forms to it. Add backend validation. Test successful registration, invalid inputs, and duplicate emails.

AI Suggested Content: The AI generated a simple in memory backend, connected the forms, added validation, and suggested test cases.

Validation: The code was reviewed manually and tested with valid inputs, invalid inputs, and duplicate emails.

Decision: Modified before use.

Reflection: The response helped set up the first backend logic and showed how to test the main registration cases.

Responsible Person: Sam Taheri

Database Task: SQLite Database Implementation

Purpose of AI Use: To help add SQLite to CareerConnect and replace temporary in memory storage with persistent storage while keeping the current project structure.

Chat Link or Prompt/Response: See screenshot.

AI Suggested Content: The AI added SQLite support, created tables for the main project data, connected registration and login to the database, and updated the storage logic while keeping the existing validation.

Validation: The changed files were reviewed and the project tests were run. Registration, login, duplicate emails, restart persistence and data storage were checked. All 51 tests passed.

Decision: Accepted.

Reflection: The AI helped connect the existing backend to a real database and keep the current features working after the change.

Responsible Person: Sam Taheri

Database A.T.: SQLite Database Setup and Persistence Testing

Purpose of AI Use: To test that the new SQLite database works correctly with registration and keeps user data saved.

Chat Link or Prompt/Response: See screenshot.

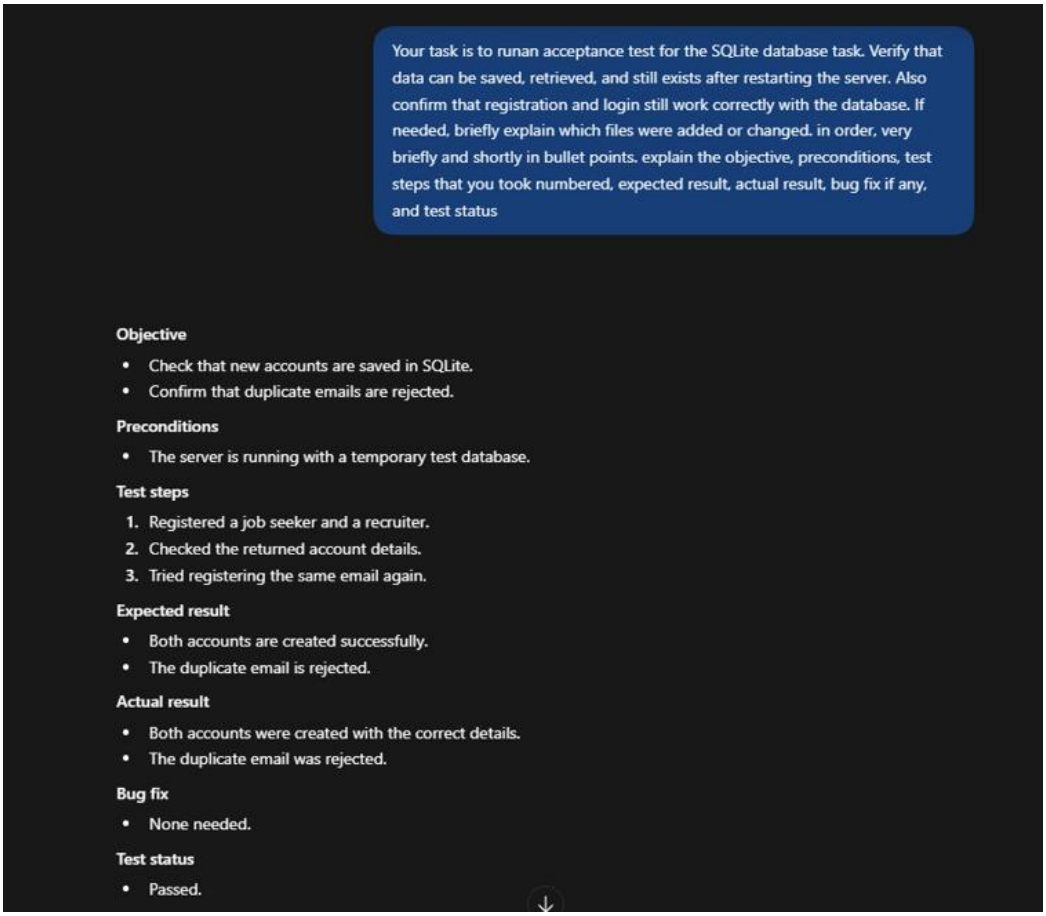

AI Suggested Content: The AI tested account storage, duplicate email handling, and database persistence after restarting the server.

Validation: The results were checked through the website and directly in the SQLite database.

Decision: Accepted.

Reflection: The tests helped confirm that the database was connected correctly and that user data stays saved after a restart.

Responsible Person: Sam Taheri

User Story 1 A.T.: Registration Acceptance Testing

Purpose of AI Use: To test the registration feature and confirm that valid accounts are saved correctly, duplicate emails are rejected, and account data stays saved after restarting the server.

Chat Link or Prompt/Response: See screenshot.

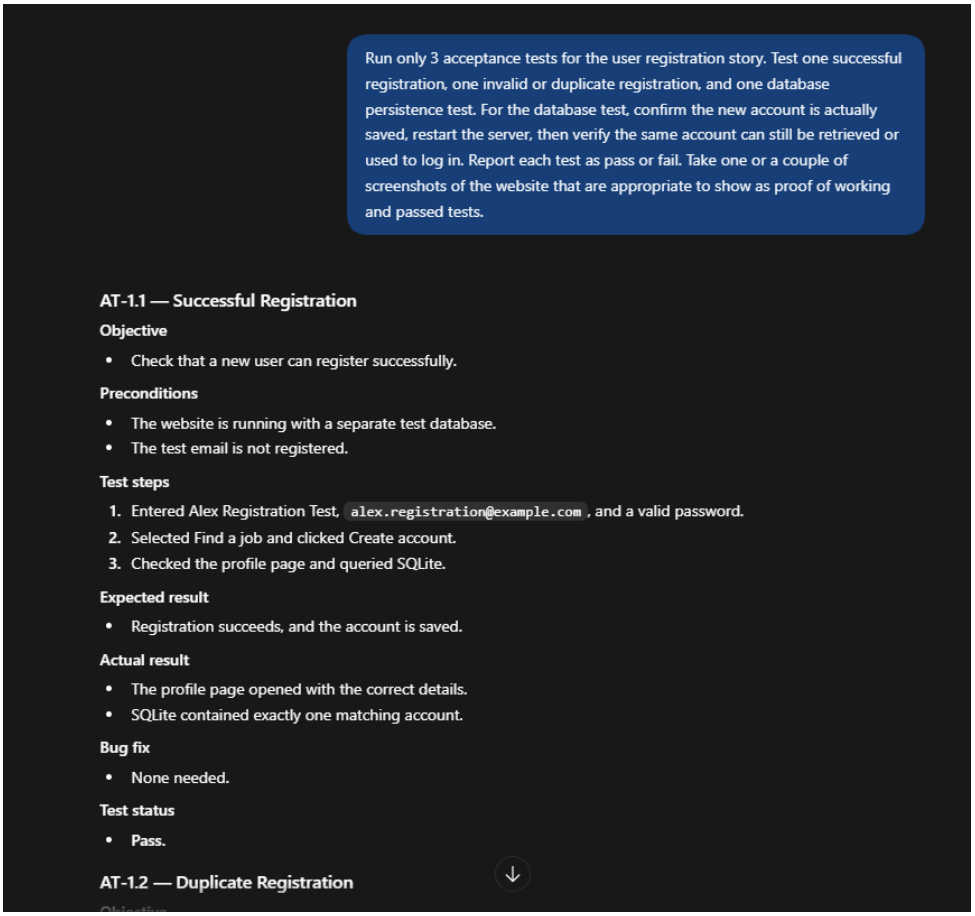

AI Suggested Content: The AI ran three acceptance tests covering successful registration, duplicate registration, and account persistence after restart.

Validation: The results were checked through the website and directly in SQLite. The account was created correctly, duplicate registration was blocked, and the same account remained saved after restarting the server. All three tests passed.

Decision: Accepted.

Reflection: The tests confirmed that registration works correctly with the database and that saved accounts remain available after a restart.

Responsible Person: Sam Taheri

User Story 2 A.T.: Login Acceptance Testing

Purpose of AI Use: To test the login feature and confirm that valid credentials work, incorrect passwords are rejected, and login still works with the SQLite account after restarting the server.

Chat Link or Prompt/Response: See screenshot.

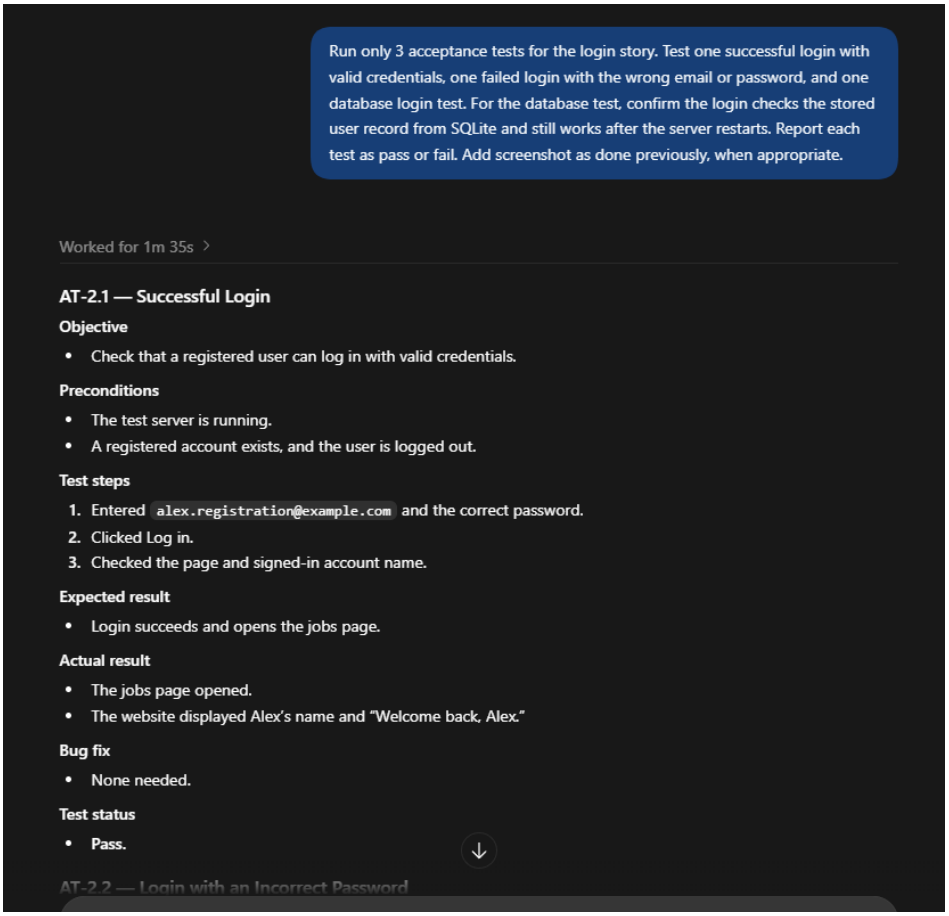

AI Suggested Content: The AI ran three acceptance tests covering successful login, incorrect password handling, and SQLite login after a server restart.

Validation: The results were checked through the website and against the SQLite account data. Valid login worked, the wrong password was rejected, and the same account could still log in after restarting the server. All three tests passed.

Decision: Accepted.

Reflection: The tests confirmed that login works correctly with the database and that stored account data is still used after a restart.

Responsible Person: Sam Taheri

User Story 3 A.T.: Logout Acceptance Testing

Purpose of AI Use: To test the logout feature and make sure the user session is properly ended. The testing also checked that the user is redirected to the correct page after logging out.

Chat Link or Prompt/Response: See screenshot.

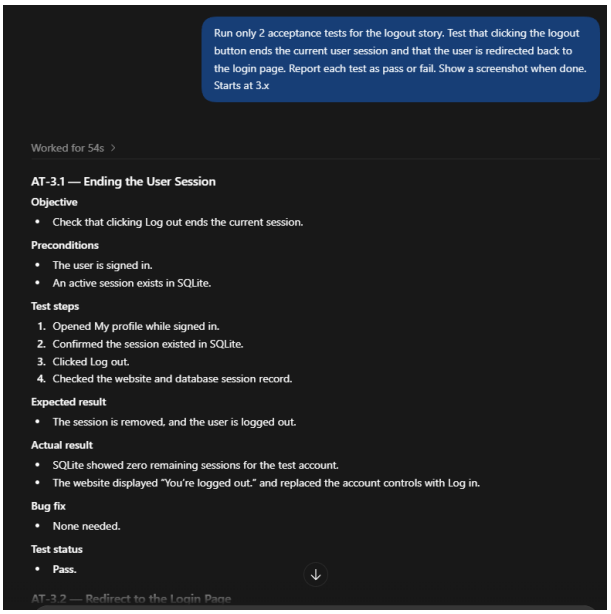

AI Suggested Content: The AI ran two acceptance tests. The first checked that the active session was removed from SQLite after logout. The second checked that the user was redirected to the login page. The second test failed because the website sent the user to the jobs page instead.

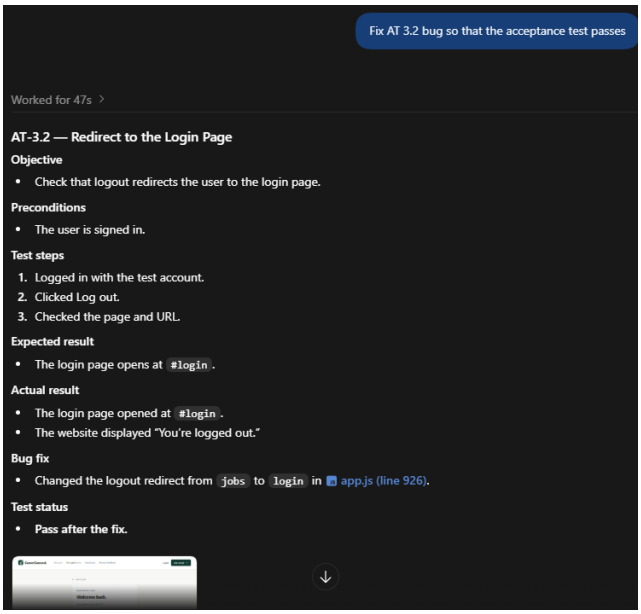

Validation: The logout behavior was checked through the website and directly in SQLite. Session removal worked correctly. The redirect problem was then fixed in app.js, changing the destination from the jobs page to the login page. The acceptance test was run again after the fix and passed.

Decision: Modified before use.

Reflection: The testing confirmed that the logout logic itself was working, but also found a small navigation bug that would have been easy to miss. After the redirect was corrected, both acceptance tests passed and the full logout flow matched the user story.

Responsible Person: Sam Taheri

User Story 3 BUG: Logout Redirect Bug Fix

Purpose of AI Use: To identify and fix the logout redirect problem found during acceptance testing.

Chat Link or Prompt/Response: See screenshot.

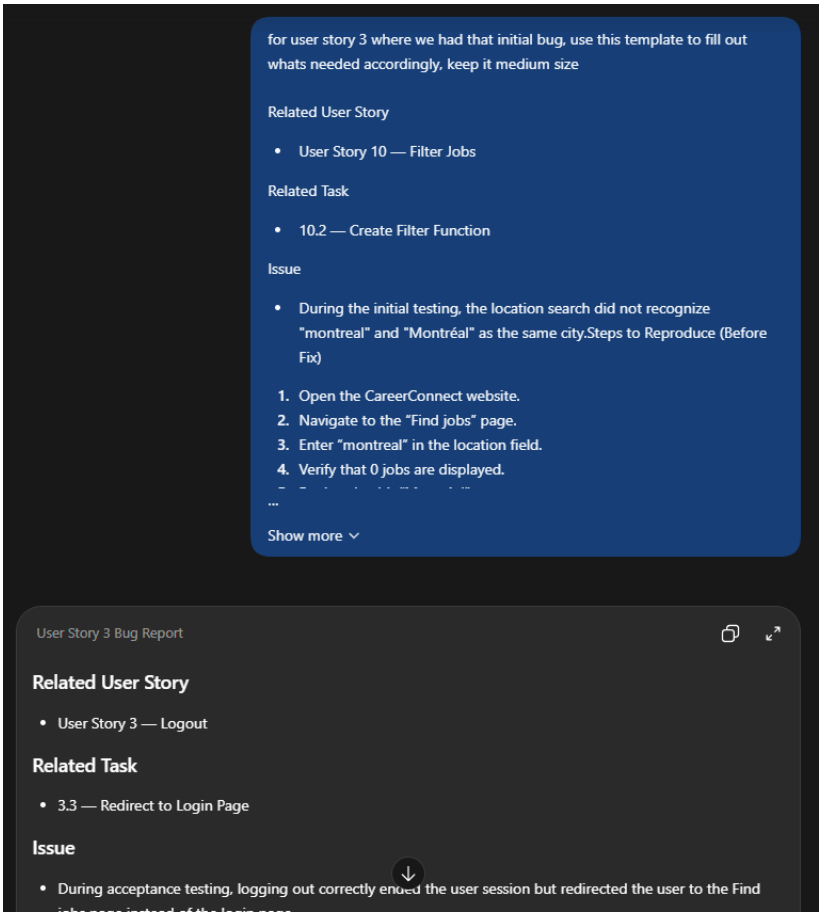

AI Suggested Content: The AI found that the logout logic was sending users to the jobs page instead of the login page and suggested changing the redirect in app.js.

Validation: The code change was reviewed and AT-3.2 was run again. The session ended correctly and the login page opened after logout.

Decision: Accepted.

Reflection: The AI helped locate the redirect issue quickly and confirm that the fix matched the user story.

Responsible Person: Sam Taheri

User Story 4 A.T.: Profile Creation Acceptance Testing

Purpose of AI Use: To test that users can create a profile, save their information, and keep the same data after restarting the server.

Chat Link or Prompt/Response: See screenshot.

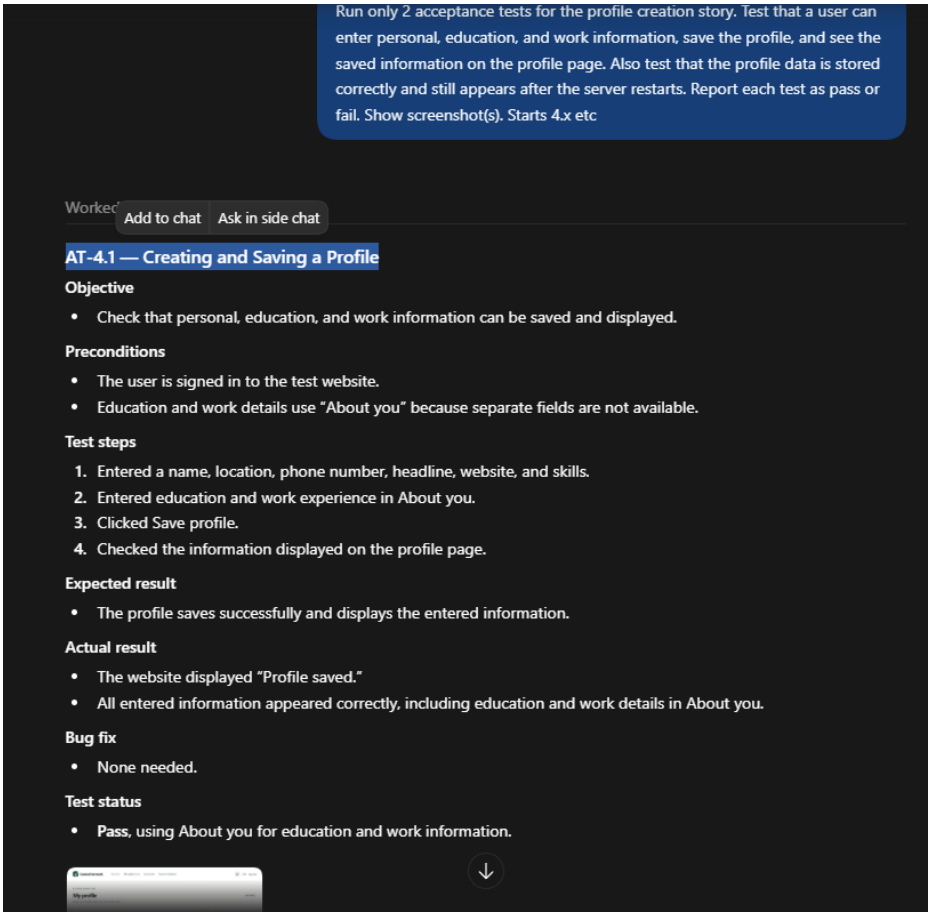

AI Suggested Content: The AI ran two tests for profile creation and database persistence. At first, education and work experience were entered through the About you section.

Validation: The profile was checked on the website and in SQLite. The data stayed saved after restart. Separate education and work fields were later added, tested again, and passed.

Decision: Modified before use.

Reflection: The tests confirmed that profile data was saved correctly and also helped identify the missing education and work fields.

Responsible Person: Sam Taheri

User Story 5: Profile Editing Implementation

Purpose of AI Use: To implement the profile editing feature before running its acceptance tests.

Chat Link or Prompt/Response: See screenshot.

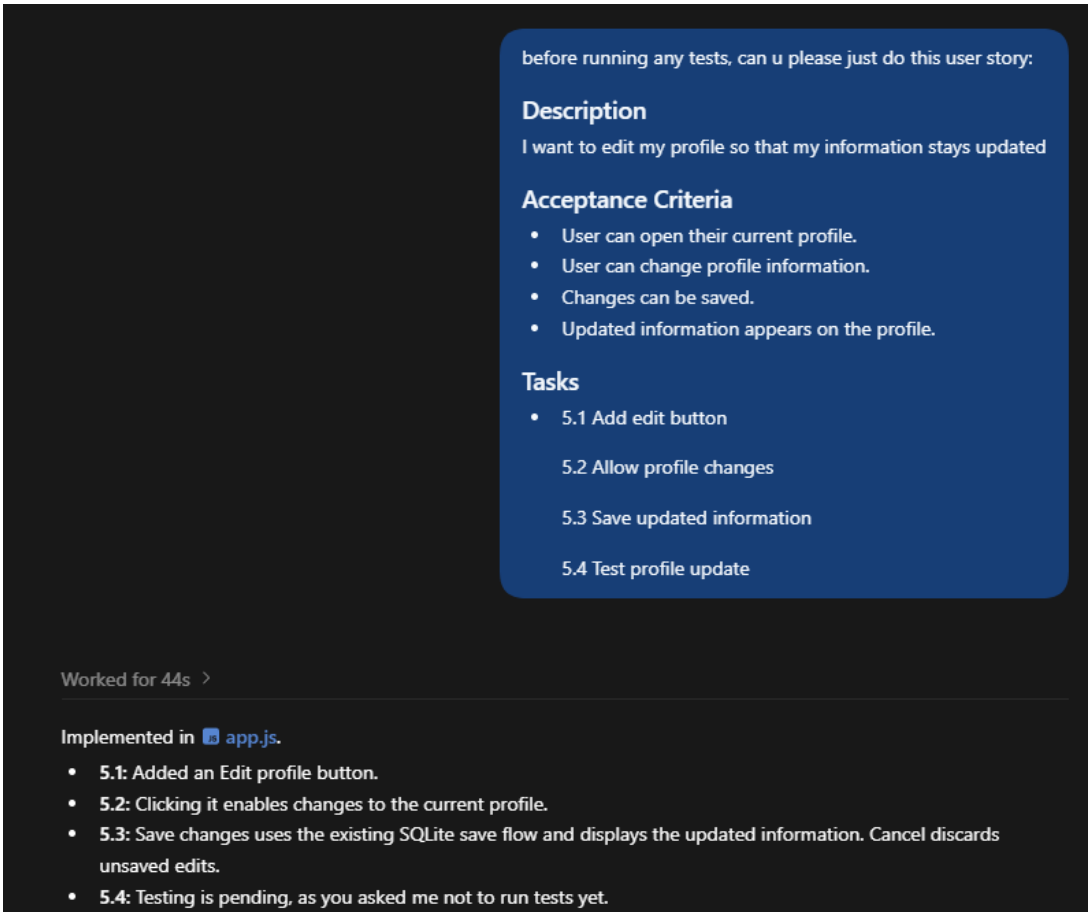

AI Suggested Content: The AI added an Edit profile button, allowed users to change their current information, and connected saving changes to the existing SQLite flow. It also added a cancel option for unsaved edits.

Validation: The changed code in app.js was reviewed and the feature was checked before testing. Formal acceptance testing was left for the next step.

Decision: Accepted.

Reflection: The AI helped complete the missing profile editing feature so it could then be properly tested against the user story.

Responsible Person: Sam Taheri

User Story 5 A.T.: Profile Editing Acceptance Testing

Purpose of AI Use: To test that users can edit their profile, save the changes, and keep the updated information after restarting the server.

Chat Link or Prompt/Response: See screenshot.

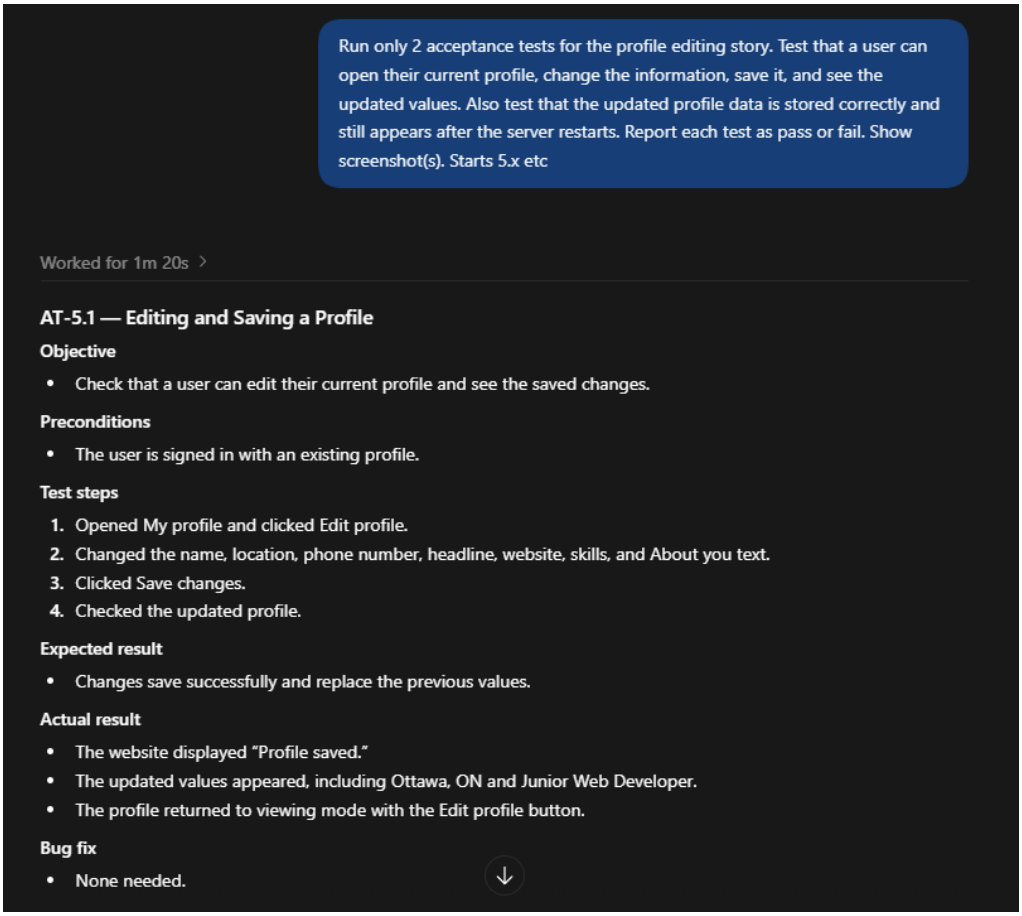

AI Suggested Content: The AI ran two tests covering profile editing and SQLite persistence after a restart.

Validation: The updated profile was checked on the website and directly in SQLite. The changed values were saved correctly, stayed linked to the same user, and remained after the server restarted.

Decision: Accepted.

Reflection: The tests confirmed that profile editing works correctly and that the updated data stays saved in the database.

Responsible Person: Sam Taheri

User Story 13: Application List Implementation

Purpose of AI Use: To implement the application tracking page so job seekers can view their submitted applications and current statuses.

Chat Link or Prompt/Response: See screenshot.

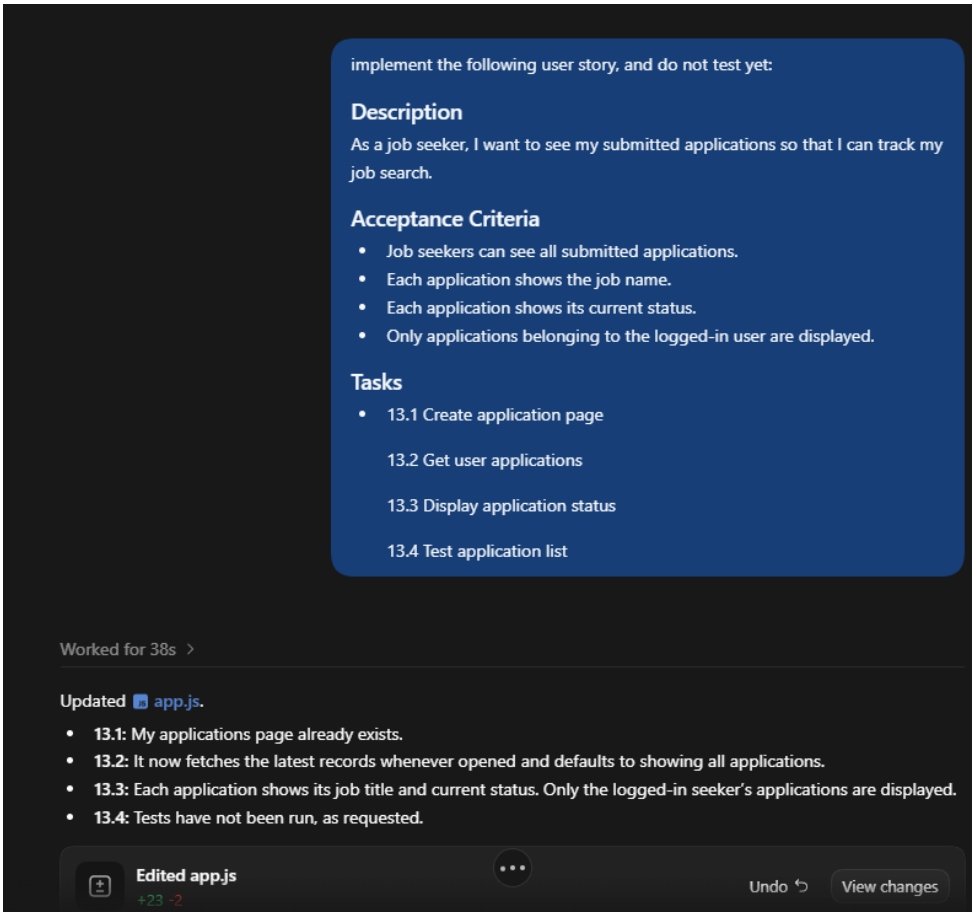

AI Suggested Content: The AI updated the existing applications page to load the latest application records, show the job title and status, and only display applications belonging to the logged-in user.

Validation: The changes in app.js were reviewed and compared with the user story requirements. Formal acceptance testing was left for the next step.

Decision: Accepted.

Reflection: The AI helped complete the missing application list behavior while keeping the existing page and project structure.

Responsible Person: Sam Taheri

User Story 13 A.T.: Application List Acceptance Testing

Purpose of AI Use: To test that job seekers can view all of their submitted applications, see the correct job names and statuses, and only access their own application list.

Chat Link or Prompt/Response: See screenshot.

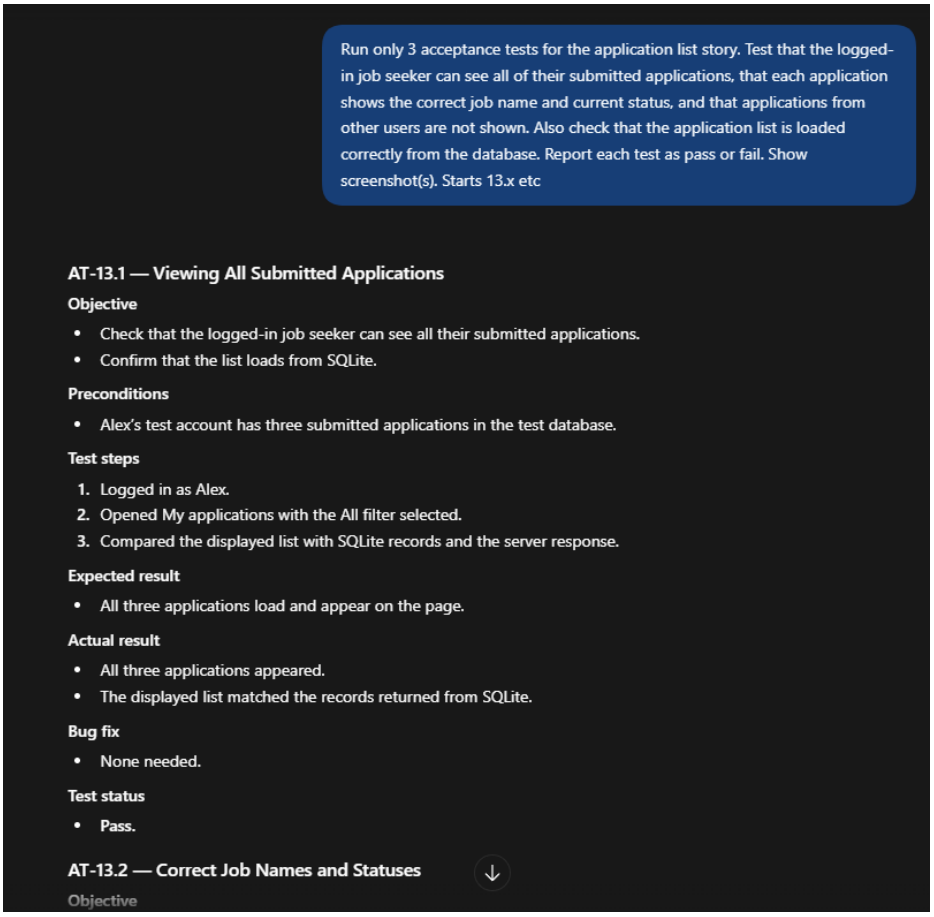

AI Suggested Content: The AI ran three acceptance tests covering the full application list, correct job names and statuses, and user specific application filtering.

Validation: The results were checked through the website, server response, and SQLite database. The displayed applications matched the database records and each user only saw their own applications. All three tests passed.

Decision: Accepted.

Reflection: The tests confirmed that the application list works correctly and that the data shown to each user matches what is stored in the database.

Responsible Person: Sam Taheri

CI Task: Update GitHub Actions Workflow

Purpose of AI Use: To update the existing main.yml so the CI workflow better reflects the project's real technical dependencies and keeps the current automated checks working correctly.

Chat Link or Prompt/Response: See screenshot.

AI Suggested Content: The AI added a check to confirm that the built in node:sqlite module is available and added comments explaining why Node.js 24 is required. It also documented the main feature prerequisites without adding unnecessary CI dependencies, packages, extra jobs, or needs: rules.

Validation: The updated workflow was reviewed and validated. The YAML parsed correctly, the Node.js 24 check passed, the SQLite check passed, and the workflow diff had no whitespace errors. The existing CI structure and automated tests were kept in place.

Decision: Accepted.

Reflection: The AI helped make the CI workflow easier to understand and maintain. It also helped separate real software dependencies from normal relationships between user stories, which avoids making the workflow more complicated than needed.

Responsible Person: Sam Taheri
